

manual-swing-trading

Manual Swing Trading — Input Review Guide

Prepared for Dick O'Leary · Oakwind strategy estate · August 2026

What this is

We measured what the Manual Swing Trading claim says against what the production paper ledger shows actually happened. Before you treat any result as final, we want you to check every input we used below — the claim document, the numbers we pulled from it, and the ledger we compared it to. Anything you correct re-runs the study automatically, and the original input stays visible alongside your correction.

Step 1 — The claim document we used

- **File:** `manual_swing_governed_backtest_artifact (5yr, 2021-05-18..2026-04-24)`
- **Seal reference:** seal `0d516728`, SEALED 2026-07-17
- **Generation date:** not stated separately — only the seal date (2026-07-17) is in the record
- **Verbatim excerpt:** "N=2,107 trades, WR=92.22%. Production leverage (1x): CAGR +342.39% (realistic 10bps)"
- **Integrity flag on this claim:** the slice flags the backtest universe behind this claim as "fleet-wide frozen survivor-biased universe (w4nfwu675)." Plain English: the pool of symbols the backtest ran over was frozen at a fixed snapshot and may leave out names that were later removed (e.g. delisted or failed) — a known way a backtest universe can flatter its own results. Direction not stated in the slice.

Your review: Is this the right / best statement of what Manual Swing Trading claims? If a better or newer claim document exists, name the file path. Is the fleet-wide frozen survivor-biased universe flag accurate, or do you have context that changes it?

- ☐ Confirmed - [] Correction: _____
- ☐ Integrity flag confirmed - [] Correction/context: _____

Step 2 — The numbers we read from the claim

Full raw line, verbatim: "N=2,107 trades, WR 92.22%; CAGR +342.39% (realistic 10bps) / +420.85% (frictionless); MaxDD -14.54% (realistic)" — metric kind: 5-year backtest, production leverage 1x.

- **Trade count:** N=2,107 trades. Not normalized (raw count, taken as-is).

- **Win rate:** WR 92.22% (2,107 trades). Normalized value: 92.22% — no adjustment made, read directly from the claim.
- **CAGR:** +342.39% (realistic 10bps) / +420.85% (frictionless). Normalized to 342.4%/yr using the "realistic-10bps variant" — the report notes this variant is *more favorable to the claim* than the frictions ASSAY would normally apply, i.e. it gives the claim the benefit of the doubt, not a stricter reading.
- **Max drawdown:** -14.54% (realistic). Not normalized — no separate normalization method stated for this figure.

Your review: one confirm/correct line per metric above.

- ☐ Trade count confirmed - [] Correction: _____
- ☐ Win rate confirmed - [] Correction: _____
- ☐ CAGR confirmed - [] Correction: _____
- ☐ Max drawdown confirmed - [] Correction: _____

Step 3 — The time window of the claim

The claim states a window: 2021-05-18 to 2026-04-24.

Your review: if you know the calendar window the backtest actually covered, state it — this single input may unlock the return comparison.

- ☐ Window confirmed as shown - [] Actual window: _____

Step 4 — The realized ledger we used

- **File:** /trisight-volume/Snapshots/swing_trade_log.csv
- **How pulled:** pulled from Railway
- **Pull date:** 2026-08-07
- **Row/trade count:** 259 closed paper trades
- **Window:** 2025-12-29 to 2026-08-06

Your review: is this the right ledger? Does a cleaner or more complete record of real fills exist anywhere? Name it if so.

- ☐ Confirmed - [] Better ledger: _____

Step 5 — The realized numbers and the known problems with them

Verbatim: "259 closed paper trades: mean +0.517%/trade, median +1.000% — but the D86 synthetic signature (pnl_pct == +1.00% AND days_held == 1) sits on 104/259 rows, and 48 rows are

BACKFILL-simulated; no aggregate win rate stated."

Three integrity flags apply to this ledger:

1. **D86 synthetic signature on 104/259 rows.** 104 of 259 rows (40%) show exactly +1.00% P&L with exactly 1 day held — a pattern flagged in the Defect Registry as D86. Direction unknown from the slice.
2. **48 BACKFILL-simulated rows.** 48 of 259 rows were added via simulated backfill rather than recorded as live fills. Direction unknown from the slice.
3. **Rows before ~2026-04-26 backfilled/synthetic.** Everything in the ledger prior to that date is backfilled or synthetic, not a live-captured trade. Direction unknown.

Your review: per flag above — is our reading right? Do you have context that changes it?

- ☐ Flag 1 (D86 signature) confirmed - [] Correction/context: _____
- ☐ Flag 2 (BACKFILL rows) confirmed - [] Correction/context: _____
- ☐ Flag 3 (pre-2026-04-26 rows) confirmed - [] Correction/context: _____

Step 6 — What we computed and what we refused

- **Return inflation: REFUSED (invalid_params).** The realized side has no computable annualized return — the report says "side not normalizable to annualized return (claim: realistic-10bps variant used (more favorable to the claim than ASSAY frictions would be); realized: none)." This traces to Step 4/5: the ledger's `normalization_method` is not stated ("n/a"), so there is nothing to ratio the claim's 342.4%/yr against.
- **Win-rate inflation: NOT COMPUTED.** The report states "a side lacks a stated win rate." This traces to Step 5: the realized ledger states no aggregate win rate, only a mean and median per-trade return.

Your review: dispute the input, not the arithmetic — which step above would you change?

Step 7 — What your feedback can unlock

- If you supply an aggregate win rate for the realized ledger, the win-rate inflation ratio becomes computable.
- If you supply a normalizable annualized-return figure for the realized side (or the raw data needed to compute one), the return inflation ratio becomes computable instead of refused.
- If you confirm whether the 104/259 D86-signature rows are real trades or placeholder/test data, the realized numbers in Step 5 can be corrected.
- If you confirm whether the 48 BACKFILL rows should count as real fills, the trade count and averages in Step 5 can be corrected.

- If you confirm what the pre-2026-04-26 backfilled/synthetic rows actually represent, the true start of the live track record can be corrected.

How corrections work

Name a file path or a correction for any item above. The record set is append-only — nothing gets overwritten. A correction supersedes the prior value, but the original stays visible, and hashes keep every version auditable. Record hashes for this review: `claim sha256:ef492cb8aa16db2eb6e6015e51c37e0249506501c03f9fb188c7a409a4a5d5f5`, `realized sha256:b58325e7caad0ae2a88af9658ddee456d29be493b93ac9611249db66d0e12d60`, `verdict sha256:7fb5cc341fa2e290bd768a4a59c76114b889ba103c998714b4ad9d1d0e03de70`.

Appendix A — The Findings Report

This is the study's findings page for this strategy, exactly as produced by the measurement run. Your input review (the pages before this) is about whether the inputs underneath THIS page are right.

Manual Swing Trading — Inflation Report

The claim

- Status: FOUND
- Stated: N=2,107 trades, WR 92.22%; CAGR +342.39% (realistic 10bps) / +420.85% (frictionless); MaxDD -14.54% (realistic) (5-year backtest, production leverage 1x) over 2021-05-18..2026-04-24
- Normalized: 342.4%/yr — method: realistic-10bps variant used (more favorable to the claim than ASSAY frictions would be)
- Sources: manual_swing governed backtest artifact (5yr, 2021-05-18..2026-04-24), sea1 0d516728 SEALED 2026-07-17
- Verbatim: "N=2,107 trades, WR=92.22%. Production leverage (1x): CAGR +342.39% (realistic 10bps)"
- Record: sha256:ef492cb8aa16db2eb6e6015e51c37e0249506501c03f9fb188c7a409a4a5d5f5

The realized record

- Status: PARTIAL
- Stated: 259 closed paper trades: mean +0.517%/trade, median +1.000% — but the D86 synthetic signature (pnl_pct == +1.00% AND days_held == 1) sits on 104/259 rows, and 48 rows are BACKFILL-simulated; no aggregate win rate stated over 2025-12-29..2026-08-06
- Normalized: NOT NORMALIZABLE — method: n/a
- Sources: /trisight-volume/Snapshots/swing_trade_log.csv (Railway, pull 2026-08-07), D86 (DEFECT-REGISTRY)
- Verbatim: "The D86 signature (pnl_pct == +1.00 % AND days_held == 1) appears on 104 of 259 rows"
- Record: sha256:b58325e7caad0ae2a88af9658dde456d29be493b93ac9611249db66d0e12d60

The verdict

Return inflation: REFUSED (invalid_params) — Manual Swing Trading: side not normalizable to annualized return (claim: realistic-10bps variant used (more favorable to the claim than ASSAY

frictions would be); realized: none). A refusal is a finding: this claim cannot be honestly ratioed against reality.

Win-rate inflation: not computed — NOT COMPUTED: a side lacks a stated win rate.

Claim and realized windows cover DIFFERENT market regimes by nature (backtest history vs 2026 paper); rate-vs-rate comparison assumes claim rates were offered as forward-looking. Realized samples are short — treat ratios as lower-noise-bound estimates, not precision measurements.

Method: annualized-return ratio (sides $\geq 60d$) + win-rate ratio (realized $n \geq 30$); normalization per declared per-side methods Record: `sha256:7fb5cc341fa2e290bd768a4a59c76114b889ba103c998714b4ad9d1d0e03de70`

How to refute this page

Open the cited sources; if any excerpt is misquoted or a better claim/realized artifact exists, supply the file path — the record set is append-only and corrections supersede with the prior kept visible.
